ASX Announcement and Media Release

RIFT VALLEY RESOURCES LIMITED

31 January 2013

Quarterly Activities Report

For the Period Ending 31 December 2012

Rift Valley Resources Limited

ABN 86 121 985 395

Level 2, MPH Building
23 Barrack Street
Perth WA 6000

Tel. +61 (08) 9200 4404
Fax +61 (08) 9200 4413

ASX Code:
RVY (Shares)

- **MIYABI**

  During the quarter, a drill program was completed comprising 107 Aircore holes, 9 RC percussion holes and one diamond drill hole. between 29 October and 4 December 2012.

  A soil sampling program commenced during the quarter to provide data for exploration targeting within the Miyabi Structural Corridor ("MSC") and more regionally in the Miyabi Greenstone belt.

- **COPORATE**

  Mrs Lyn Tomlinson was appointed as Chief Financial Officer and Company Secretary.

PROJECTS

1. MIYABI PROJECT (Rift Valley earning 75%)

MIYABI DRILLING PROGRAM

A total of 117 holes for 4,290 metres of drilling were completed in the second phase of 2012 drilling. The drilling was undertaken using a multi-purpose drilling rig contracted from Ausdrill.

The Chui Prospect was the focus of the follow up drilling program because, while the strike extent of the high-grade Dalafuma Prospect was confirmed during the August drilling program, the extent of the Chui Prospect was unknown.

Chui Prospect

The objectives of the drill program at the Chui Prospect were to investigate the continuity of an interpreted zone of mineralisation by drilling Aircore fences, and to obtain drill data perpendicular to the strike of the interpreted mineralisation.

Chui Aircore drilling

The results received for Aircore drill fences showed that high grade mineralisation was not continuous along the interpreted length of the Chui Prospect, indicating that the Chui gold zone is probably more structurally complex than indicated by the initial drilling program. Mineralisation may comprise a series of discontinuous *en echelon* zones rather than a single 900 metre long mineralised zone as previously interpreted.

Chui RC drilling

RC Drilling at the Chui Prospect confirmed the high grade mineralisation intersected on section 4600E and previously reported in Hole MBRC378 (11 metres @ 23.0 g/t gold from 54m depth). The new drill hole MBRCD001 intersected **12 metres @ 6.02 g/t gold from 33 metres** in the RC percussion pre-collar and extending to the end of the pre-collar (Appendix 1). Results from the diamond core extension to this hole from 45 metres depth showed the high grade mineralisation did not continue down hole and that the strike extent of this mineralisation could not be confirmed (it was not intersected on the Aircore drill lines 100 metres either side of this section).

Another previously identified zone of significant mineralisation was also confirmed by drill hole MBRC387 (on section 4100E) with the best intercept comprising **15 metres @ 1.24 g/t Au** from 21 metres to 36 metres down hole (Appendix 1). The strike extent of this mineralisation is also not known as it was not intersected along strike in the Aircore drill lines 100 metres either side of this section.

Regional Geophysical Targets

Three Regional Geophysical Targets were identified by an interpretation using geophysical information. A single traverse of Aircore drill holes was completed at two of the targets and two traverses of drilling were completed on the third target.

The first-pass drilling south of N'dagalu (which lies within the Miyabi Structural Corridor) has shown some encouraging intersections which will be followed up in due course.

The best intersections south of N'dagalu were from two drill holes located 20 metres apart on section 8900E. Drill hole MBAC357 returned **3 metres @ 1.59 g/t gold** (from 15 metres down hole) and MBAC356 returned **3 metres @ 0.68 g/t gold** from 36 metres down hole (*note: a table of assay results is provided in Appendix 1, true width of the intersection is interpreted to be 70% of the drill hole intercept)*.

FUTURE WORK PROGRAM

Exploration work will continue at Miyabi to infill and interpret the soil sampling grid within the Miyabi Structural Corridor aimed at targeting additional zones of mineralisation.

Work over the next quarter will be focussed on:

a) A regional soil sampling program to aid in identifying additional drilling targets;
b) Regional geological mapping programs outside the MSC; and
c) Continued analysis of existing regional geological and geophysical data for exploration targeting.

MIYABI GOLD PROJECT – BACKGROUND

The Miyabi Gold Project is located approximately 200 kilometres southwest of the city of Mwanza in the Lake Victoria Goldfields, Tanzania (Figure 1). The property has Mineral Resources contained in several deposits totalling 12.4 million tonnes at 1.3 g/t gold. This Resource comprises 520,000 ounces of gold (at a 0.5 g/t cut-off), estimated in accordance with JORC (2004). The resource comprises 370,000 ounces of Indicated Mineral Resource and 150,000 ounces of Inferred Mineral Resource and was estimated in 2006.

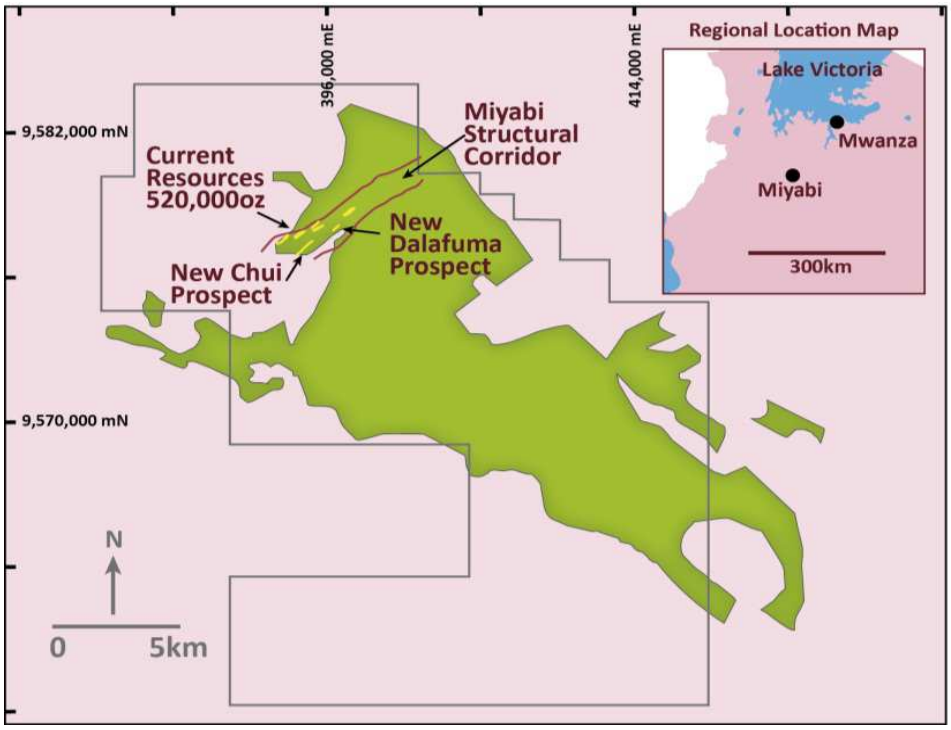

Figure 1 - Miyabi Project location, resource area, and new prospects

In April 2011, the Company entered into a joint venture with African Eagle Resources plc where Rift Valley may earn a 75% interest in the Project by sole funding exploration to completion of a bankable feasibility study.

Six of the seven individual gold resources estimated to date occur in an *en echelon* pattern of shear zones within a major structural corridor that cuts across the northwest corner of the Miyabi greenstone belt. This major structural corridor is named the **Miyabi Structural Corridor** which trends northeast to southwest extending for a length of 7.7 kilometres through the Miyabi property and is some 800 to 1,000 metres wide (Figure 1).

The existing gold resources within the MSC extend along a strike length of approximately 3.5 kilometres in the south western half of the structure and are clustered over a width of approximately 500m from the centre of the structure towards its northern boundary (Figure 2).

The potential for new zones of gold mineralisation within the MSC, but outside the area of current resources, was demonstrated with the discovery of the Dalafuma and Chui Prospects in mid-2012.

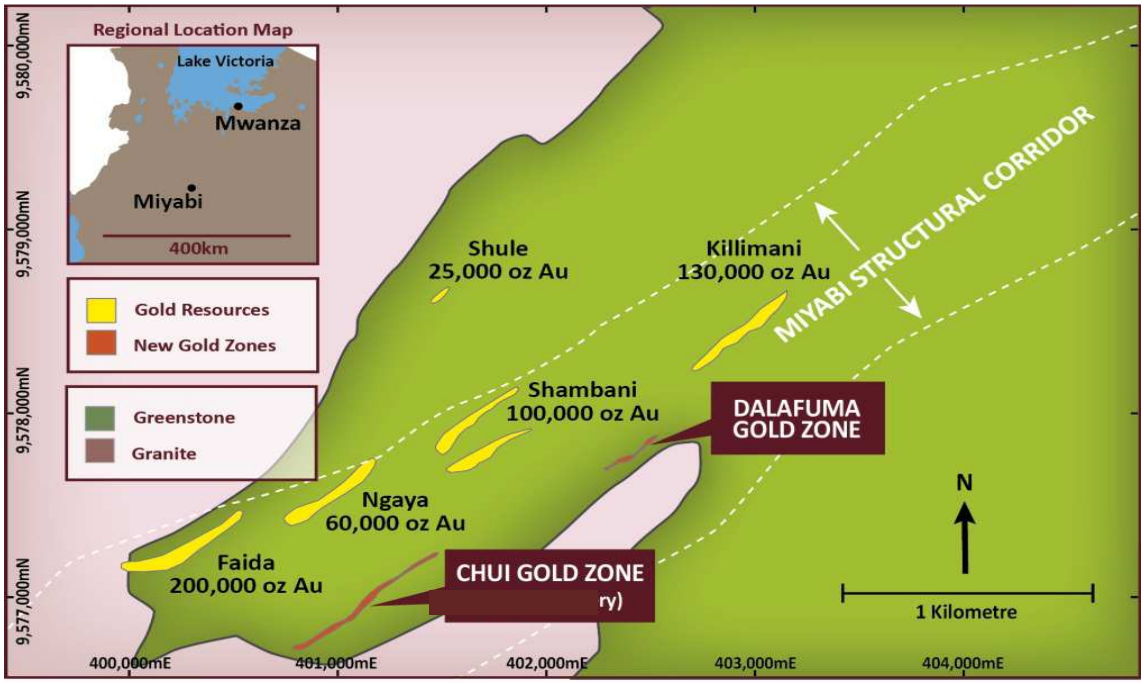

Figure 2 - Miyabi Structural Corridor

2. KITONGO PROJECT (Rift Valley 100%)

The Kitongo Project is located approximately 90 kilometres south of the city of Mwanza in the Lake Victoria Goldfields, Tanzania. The property has a Mineral Resource delineated in 2006, in accordance with JORC (2004), totalling 7.82 million tonnes at 1.5 g/t gold, containing 370,000 ounces applying a 0.5 g/t cut-off grade. The resource is presently allocated as Inferred Mineral Resource Category due to insufficient technical data including rock density measurements and quality control information.

FUTURE WORK PROGRAM

Rift Valley has planned a 3,500 metre drilling program aimed at increasing the potential resource, however, this program is presently pending Government intervention to remove illegal small scale miners from the site. A stakeholders meeting was held on 26 November 2012 in Tanzania, which included the Minister for Energy and Minerals. This has provided positive impetus for re-commencing exploration activity in the near future.

3. MAJI MOTO PROJECT (Rift Valley 100%)

The Maji Moto Project is located in the Musoma region of the Lake Victoria Goldfields, Tanzania. The Maji Moto property is centred on the old colonial-era Maji Moto gold mine and the 77 square kilometre area covers a number of small scale gold workings surrounding the mine.

Note: A 500 square metre area over the historic Maji Moto mine is currently held by small scale miners.

Rift Valley Resources continued systematic exploration on the property during 2012. The program has included geological mapping, surface rock chip sampling, geochemical soil sampling and resampling of 26 historical trenches. Work so far has generated the following main targets previously reported as Nyakikoni, Mesaga and Magateni.

Nyakikoni Prospect: Geochemical soil sampling defined a gold anomaly extending over a 1.0 by 1.5 kilometre area and centred only approximately 1 km southwest from the Maji Moto mine. The prospect and mine both lie on the same granite-greenstone contact. Detailed surface mapping has revealed the source of most of the anomaly is numerous small gold bearing quartz shear zones which do not warrant drill testing. However, the western one third of the anomaly is situated over an area of alluvial gold workings which are directly along strike of the shear zone that hosts the Maji Moto mine. The alluvial material is not shedding from the mine itself and may represent a new buried mineralised zone. Aircore drilling to locate the source of the alluvial gold has been planned.

Mesaga Prospect: Old colonial workings named the Mesaga are located approximately 2 kilometres west of the Maji Moto mine. Old pits and shafts have been developed over a 200 metre strike length on multiple quartz veins in a 10 metre wide shear zone. Potential strike extensions of the workings are covered by relatively thick soils. A 6-hole RC drilling program has been planned to test the known workings and immediate strike extensions.

Magateni Prospect: Wide spaced geochemical soil sampling has defined a gold anomaly on Magateni Hill some 6 kilometres northwest of the old Maji Moto mine. Detailed mapping has not been able to locate the source of the anomaly and infill soil sampling results are awaited.

FUTURE WORK PROGRAM

Future work will focus on consolidation of the exploration results obtained during the year with the combined package of tenements resulting from the merger between Rift Valley Resources Ltd and BrightStar Resources Ltd.

4. MICLERE PROJECT (Rift Valley 100%)

The Miclere Project is located approximately 30 kilometres northwest of Clermont in Central Queensland, Australia. The Project hosts potentially significant placer gold mineralisation but the Company's current focus has been in Tanzania and no work was undertaken at Miclere during the quarter.

***Competent Person**: The information in this document that relates to the Exploration Results or Mineral Resources of Rift Valley Resources Ltd is based on information compiled by Michael McKevitt, who is a member of the Australasian Institute of Mining and Metallurgy. Mr McKevitt is a full time employee of Rift Valley Resources Ltd. Mr McKevitt has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr McKevitt consents to the inclusion in this document of the matters based on his information in the form and context in which it appears in this document.*
